AGREEMENT ON THE CONSERVATION OF POPULATION OF EUROPEAN BATS

A. General Information

Name of Party: Lithuania
Date of Report: March 2007
Period covered: March 2006–March 2007
Competent Authorities: The Nature Protection Department of the Ministry of Environment of the Republic of Lithuania

B. Status of Bats within the Territory of Lithuania

1. Summary Details of Resident Species

15 bat species occur in the territory of Lithuania.

However, several of them are very rare:

- *Myotis mystacinus* (Whiskered bat). Presumably it is a rare species, because so far only a single locality has been known (in the northern part of Lithuania where a skull has been found in a limestone cave).
- *Nyctalus leisleri* (Leisler’s bat). It is characterised as a rare species, because only a few observations found during autumn bat migration in the western and eastern parts of Lithuania.

Several of them are common:

- *Plecotus auritus* (Brown long-eared bat), *Myotis daubentoni* (Daubenton’s bat) and *Pipistrellus nathusi* (Nathusius’ pipistrelle) are confirmed to be common and widespread species.
- *Pipistrellus nathusi*, *Nyctalus noctula*, *Pipistrellus pipistrellu*, *Eptesicus nilssonii*, *Eptesicus serotinus* and *Vespertilio murinus* are common species during autumn bat migration along the Baltic Sea coast.
- *Myotis dasycneme* (Pond bat). The status is vulnerable, because it is quite rare and locally distributed, recorded mostly in the north-eastern, eastern and south-eastern parts of Lithuania. Summer status is known insufficiently, in winter the species is found in the Vilnius hibernating sites and Kaunas fortress.

Eleven (11) bat species as endangered, vulnerable or of unknown status are protected in Lithuania and listed in the Lithuanian Red Data Book. They are as follows: *Myotis dasycneme*, *Barbastella barbastellus*, *Nyctalus leisleri*, *Vespertilio murinus*, *Myotis nattereri*, *Myotis brandii*, *Pipistrellus pipistrellus*, *Plecotus auritus*, *Eptesicus nilssonii*, *Nyctalus noctula*, *Eptesicus serotinus*.

3. **Habitats and Roost Sites**

There are quite many habitats, which are used by bats in Lithuania, such as former manor houses, widely distributed estates with old parks in small towns and settlements in the countryside, coastal forests, broad-leaved forests and town parks (especially during bats breeding season).

4. **Threats**

The number of people interested in bats has substantially increased. Scientists find signs of visitors on the hibernation sites. The disturbance is particularly dangerous during the hibernation season. Another problem is martens, rats and cats feeding on bats during the hibernation season.

Highly toxic chemicals are not used in Lithuania, but pesticides corresponding to all the EU requirements are used in our country.

5. **Data collection and research**

Data have been collected and researched by:

- Institute of Ecology of Vilnius University;
- Veterinary Institute of Lithuanian Veterinary Academy;
- Society for Lithuanian Bat Survival;
- Lithuanian Ringing Centre.

Data have been collected by:

- State Protected Areas Service under the Ministry of Environment;
- Ministry of Environment of the Republic of Lithuania.

6. **C. Measures Taken to Implement Article III of the Agreement**

6. **Legal measures taken to protect bats, including details of enforcement actions to support such measures**

Several main national laws in the field of nature protection should be mentioned, where issues of wildlife conservation (including the conservation of bats as well) are included:
• Law on Protected Areas (1993, (as) amended in December 2001);
• Law on Wild Fauna (1997, (as) amended in December 2001);
• Law on Protected Plant, Animal and Fungi Species and Communities (1997, (as) amended in December 2001);
• Government Resolution No. 130 of 7 February 2005 on the approval of the National Biodiversity Monitoring Programme for 2005-2010;
• Government Resolution No. 276 of 15 March 2004 on the approval of the General Statutes for SCI and SPA;
• Order of Minister of Environment No. D1-144 of March 31, 2006, concerning the amendment of Order No. 159 on the list of the animals and plants species of importance of EU and that are founded in Lithuania;
• Order of Minister of Environment No. D1-518 of November 6, 2006, concerning the amendment of Order No. D1-302 on the compilation of the list of the sites that meet pSCI's criteria, and the submission of the list to the EU together with the list of the habitats and species of EU importance found on these sites;
• Order of Minister of Environment No. D1-174 of March 23, 2007, concerning the amendment of Order No. 504 on the protected plant, animal and fungi species listed in the Lithuanian Red Data Book.

7. Sites identified and protected, which are important for the conservation of bats

5 territories of hibernating sites for *Barbastella barbastellus* and 6 territories of feeding areas for *Myotis dasycneme* and 2 hibernating sites for *M. dasycneme* are presently nominated.

8. Consideration given to habitats which are important to bats

The situation is similar every year. A lot of the known roosts and habitats important to bats in Lithuania are located in protected areas – national or regional parks, reserves, NATURA 2000 sites, etc. It is hoped that bats will benefit from the general and individual rules applied for protected habitats in these areas.

9. Activities to promote the awareness of the importance of the conservation of bats

Bat night events are organized in regional parks every year.

Researches on biodiversity of bats hibernating sites carried out in Pajuris Regional Park and Žemaitija National Park.

The Society for Lithuanian Bat Survival has hanged 600 nesting-boxes for *Pipistrellus natthusii* in the 30th protected areas for the purpose to research their migration. Eurobats financially supported this project.

The leaflets “The Restoration of Bat Hibernating Sites” were produced by State Protected Areas Service under the Ministry of Environment.

More than 6 articles about bats conservation and their life were published in magazines and newspapers, there were developed and presented some promotion information programmes about bats on TV.

The scientific articles and books:

**10. Responsible bodies, in accordance with Article III.5 of the Agreement, nominated for the provision of advice on bat conservation and management**

The Competent Authority is the Nature Protection Department of the Ministry of Environment of the Republic of Lithuania.

Scientific Authorities are the Lithuanian Society for Bat Conservation and the Institute of Ecology of Vilnius University.

**11. Additional action undertaken to safeguard populations of bats**

The Ministry of Environment and the Institute of Ecology of Vilnius University organised several seminars about bat migration for the ecologists from the regional parks and other protected areas, and for Vilnius citizens.

**12. Recent and ongoing programme (including research) related to the conservation and management of bats**

Baranauskas K., 2006. The Nature Management Plan for Most Important Bats Hibernating Sites in the Vilnius City (the draft version is about *Barbastella barbastellus* and *Myotis dasycneme* species protection programme; developed under a project “Protection of endangered species of habitats through the implementation of CITES and the Bern and Bonn Conventions and the related EU legislation”). – Vilnius.

Lithuanian bat's experts assisted of scientists from Estonia and Finland carried out the bats monitoring in the main Kaunas and Vilnius hibernation sites during the last week of January and the beginning of February.

Veterinary Institute of Lithuanian Veterinary Academy is working on bat rabies in Kaunas district.

**13. Consideration being given to the potential effects of pesticides on bats, and efforts to replace timber treatment chemicals which are highly toxic to bats**

There was no special consideration on this point in Lithuania.

**D. Functioning of the Agreement**

**14. Cooperation with other parties and range states**

There is a cooperation with the bat's experts and scientists from Latvia, Estonia, Finland, the Netherlands and other countries. Experts from these countries carried out the consultation and research with Lithuanian specialists.
